

Ecological Modeling

WLF 5520, Fall 2027

Theory and practice modeling individuals, populations, and communities in heterogeneous environments

Learn:

- Construction of spatially-explicit and aspatial models of individual behavior, fitness, population regulation, metapopulations, and species interactions.
- Analysis of stability, population viability, harvest and conservation actions.
- Intensive use of R programming to simulate and explore ecological processes.
- Students develop model of their research system.

Fall of odd years, 3 credits
Tu & Th 9:30 – 10:45
